

Problem Statement

Defining the core user problem that Gem Finder solves

How Might STATEMENT

How might Manhattan visitors find high-rated attractions at their least crowded moments, so they can have a memorable experience without wasting time or missing out due to high busyness?

User Need

Travelers who want great sightseeing experiences in Manhattan need a way to identify which highly-rated attractions are least busy at specific times on a given day or the next day.

Insight

Existing apps rank attractions by overall rating, but fail to factor in crowdedness timing — a 4.8-star landmark at 2 PM on a Saturday is a fundamentally different experience from the same spot at 9 AM on a Tuesday.

Root Cause

Rating apps optimize for what to visit, not when
Crowd data exists but is not actionably used

Impact

Tourists waste hours in lines or leave disappointed
Mobility-impaired users face extra risk with no filtered data

Success Criteria

Users discover a highly-rated, low-crowd "gem" for today or tomorrow

CORE PROBLEM STATEMENT

Manhattan visitors with a preference for specific attraction types struggle to identify which high-rated spots will deliver the best experience at a particular time — because no current travel product combines attraction ratings with busyness-level predictions. This leads to overcrowded visits, disappointment, and missed "gem" experiences that require both high quality and low busyness.
